In the trenches

The military approach to IT security

Alan Woodroffe

IT Security Issues

- ◆ Design and Training considerations
- ◆ Interoperability / Complex Systems
- ◆ Resilience
- ◆ Reliability / Encryption
- ◆ In-Service Updates
- ◆ Disposal - Emergency and Scheduled
- ◆ The classic: Confidentiality - Integrity - Availability

◆ Design Considerations

- ◆ “Squaddie proof” – able to be dropped from the back of a truck and still function

- ◆ Modern rugged laptops

- ◆ Extremes of temperature

- ◆ Desert

- ◆ Polar regions

◆ Accreditation

- ◆ The UK Defence Security Standards Organisation (DSSO) tests UK MoD IT systems
 - ◆ Identify key risks to the project
 - ◆ Ensure correct user procedures
 - ◆ Ensure correct secure system configuration
 - ◆ Ensure strong enough encryption
 - ◆ User education is a major part of System Security

◆ Training

- ◆ UK MoD staff are often “in post” for only 2 years
 - ◆ Staff require training when posted in to a job
 - ◆ Staff are given varied careers and may have little prior IT experience
 - ◆ Thorough and comprehensive standards are required so new staff can learn without a handover

◆ Interoperability

- ◆ UK MoD project procurement used to be 10 years

- ◆ New equipment must operate with old

- ◆ UK MoD often operates in Coalition scenarios
 - ◆ Equipment must operate with Coalition partners'

◆ Complex Systems

◆ Example: BOWMAN

- ◆ 48,000 radios & 26,000 computers
- ◆ 9,500 Local area Sub-System installations
- ◆ 20,000 vehicles
- ◆ 43 capital ships (158 all types)
- ◆ 350 aircraft
- ◆ 100,000+ trained servicemen

◆ Complex Systems

◆ Example: Eurofighter

- ◆ 4 nation interoperability
- ◆ On-going development
- ◆ Ground-breaking
- ◆ Use of biometrics
- ◆ PKI
- ◆ Air system supported by wide range of ground systems

◆ Resilience

- ◆ Military systems must be resilient and continue to operate when under attack from an enemy force
 - ◆ Resilience can be built into IT systems nodes (and spares)
 - ◆ Resilience can be built into IT systems networks
 - ◆ ARPANET (1969 – 4 nodes!) relied upon network resilience
 - ◆ UUCPNet (1983 – 550 nodes – including alan@rocc) relied upon resilience in customised scripts and “hosts” files
 - ◆ TCP/IP (official protocol on ARPANET from Jan 1983) relies upon resilience in the hosts and network nodes

◆ Reliability / Encryption

- ◆ Military systems must be reliable
 - ◆ Systems should work first time
 - ◆ Systems should guarantee to do their task; once a command has been given a user should assume that the action has been successfully completed
- ◆ Military systems must guarantee that any message transmitted or stored cannot be accessed by an enemy
- ◆ False/idle data may be sent to prevent traffic analysis

◆ In Service Updates

- ◆ The DSSO Accreditation is not a one off process
 - ◆ Technology will be enhanced, software will be updated
 - ◆ Systems and connectivity to them will change over time
 - ◆ System usage will change over time as requirements evolve
 - ◆ New threats to systems will emerge and must be countered
 - ◆ In time, the business reason behind the original system will change
- ◆ Systems should be re-accredited during their life

◆ Disposal - Emergency

◆ Items of most value: equipment or Data?

- ◆ May not be possible to recover equipment
- ◆ Equipment destruction at point of no return
- ◆ Data must be destroyed if lost
- ◆ Remote device disabling
- ◆ Remote data destruction
- ◆ Recognition of data compromise if destruction not possible

◆ Disposal - Scheduled

- ◆ Data must be purged from equipment before that equipment may be re-used within an organisation
- ◆ Data must be erased from equipment before that equipment may be disposed of from an organisation
- ◆ Data disposal is a key part of a system design
- ◆ Data disposal must be available through system's life

◆ Information Security Classic - CIA

◆ Confidentiality

- ◆ You don't want your enemy to eavesdrop on your communications or read your files if they capture your equipment

◆ Integrity

- ◆ When you send an instruction, you expect it to be received exactly as you sent it, not garbled

◆ Availability

- ◆ You need to be able to use your systems as and when you need to, you don't want them knocked out just as you start an offensive

- ◆ Confidentiality

- ◆ Military

- ◆ Intentions

- ◆ Capabilities

- ◆ Broadcast

- ◆ Information sources

- ◆ Integrity

- ◆ Military

- ◆ Intelligence must be reported correctly

- ◆ Orders must be disseminated without corruption

- ◆ Broadcast

- ◆ Must report facts correctly in order to maintain credibility and trust of listeners/viewers

◆ Availability

◆ Military

- ◆ To be able to report intelligence when it occurs
- ◆ To be able to issue orders when required

◆ Broadcast

- ◆ To file stories when the journalist wants/needs to
- ◆ To transmit programmes on schedule
- ◆ To distribute on-line content on demand from user

- ◆ One of the main aspects of Information Security is the provision of effective barriers to prevent users from doing what they shouldn't ... ☺

- ◆ Military v Broadcast Information Security

- ◆ Military tends towards the C and I of CIA

- ◆ **Confidentiality** **Integrity** Availability

- ◆ Broadcast tends towards the I and A of CIA

- ◆ Confidentiality **Integrity** **Availability**
